

the 1990s, the number of people in the world who are under 15 years of age is expected to increase by 1.5 billion (United Nations 1994).

There is a growing awareness of the need to provide a better quality of life for the world's children. The United Nations Children's Fund (UNICEF) has been instrumental in this regard, and has developed a series of indicators to monitor the progress of children's development. The first of these is the *Infant Mortality Rate* (IMR), which is the number of children under the age of five who die each year per 1,000 live births. The second is the *Under-Five Mortality Rate* (U5MR), which is the number of children under the age of five who die each year per 1,000 live births. The third is the *Infant and Child Mortality Rate* (ICMR), which is the number of children under the age of five who die each year per 1,000 live births.

These indicators are used to monitor the progress of children's development, and to identify areas where improvement is needed. They are also used to compare the progress of different countries, and to identify the factors that influence children's development.

The *Infant Mortality Rate* (IMR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

$$\text{IMR} = \frac{\text{Number of children under the age of five who die each year}}{\text{Number of live births}} \times 1,000$$

The *Under-Five Mortality Rate* (U5MR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

$$\text{U5MR} = \frac{\text{Number of children under the age of five who die each year}}{\text{Number of live births}} \times 1,000$$

The *Infant and Child Mortality Rate* (ICMR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

$$\text{ICMR} = \frac{\text{Number of children under the age of five who die each year}}{\text{Number of live births}} \times 1,000$$

These indicators are used to monitor the progress of children's development, and to identify areas where improvement is needed. They are also used to compare the progress of different countries, and to identify the factors that influence children's development.

The *Infant Mortality Rate* (IMR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

$$\text{IMR} = \frac{\text{Number of children under the age of five who die each year}}{\text{Number of live births}} \times 1,000$$

The *Under-Five Mortality Rate* (U5MR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

$$\text{U5MR} = \frac{\text{Number of children under the age of five who die each year}}{\text{Number of live births}} \times 1,000$$

The *Infant and Child Mortality Rate* (ICMR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

$$\text{ICMR} = \frac{\text{Number of children under the age of five who die each year}}{\text{Number of live births}} \times 1,000$$

These indicators are used to monitor the progress of children's development, and to identify areas where improvement is needed. They are also used to compare the progress of different countries, and to identify the factors that influence children's development.

The *Infant Mortality Rate* (IMR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

The *Under-Five Mortality Rate* (U5MR) is the number of children under the age of five who die each year per 1,000 live births. It is calculated as follows:

How strange... (print)

Tess Jaray

Not on display

Title/Description: How strange... (print)

Artist/Maker: Tess Jaray

Born: 2001

Object Type: Print

Materials: Paper

Measurements: h 103.5 x w 77 cm (frame: 118.5 x 90.7 cm)

Accession Number: 31409Eii

Historic Period: 21st century

Production Place: London

Copyright: © All Rights Reserved Tess Jaray
